

Spring conveyor

The spring conveyor offers superior flexibility and a specific spring range. A tilting chute at the end of the conveyor provides for a gentle transport of the products.

The machine operates in a product-related manner because it is equipped with a computer and step motor control as well as individual product query. Your products are positioned with millimetre accuracy at a cycle rate of up to 55 pieces / min.

This machine is mainly used in the food industry for placing soft products into packaging trays.

The system is manufactured from 1.4031 grade stainless steel and synthetic materials approved for the food industry.

We will customise the machine according to your needs.
